카드 요약 / 당시 확인 내용

EPA said on May 19 that it had approved CarriCea T1, a breakthrough citrus rootstock designed to help trees defend themselves against citrus greening disease. The agency said Florida citrus production is down 95% since the early 2000s and argued the new rootstock can reduce the need for conventional pesticide sprays by addressing disease pressure at its source. The article is important because it frames disease - resistance tools as part of the crop - protection stack, not outside it.
