카드 요약 / 당시 확인 내용

World Grain reported on June 5 that surging fertilizer prices are beginning to reshape grain production as farmers cut nutrient use, switch into less input-intensive crops, or reduce planting. The article said European Commission figures show urea prices have jumped 55% since the conflict began and cited FAO warnings that global fertilizer prices could average 15% to 20% higher in the first half of 2026. The implication is a growing risk to wheat, corn, and barley output.
