카드 요약 / 당시 확인 내용

University of Nebraska - Lincoln CropWatch reviews newly registered and newly available herbicide options for weed control in corn and soybean production, covering modes of action, application timing and resistance management value. Recently approved active ingredients include epyrifenacil, a PPO - inhibiting herbicide for corn, soybeans, wheat, canola and fallow ground; diflufenican, a Group 12 PDS - inhibiting herbicide described as the first effective PDS inhibitor for control of waterhemp, Palmer amaranth and other pigweed species in corn and soybean; and trifludimoxazin. Extension specialists emphasize that new chemistries should be integrated into diversified programs rather than used as stand - alone solutions to preserve their utility against herbicide - resistant weeds.
