카드 요약 / 당시 확인 내용

Nebraska Extension's weekly field update addresses Palmer amaranth control in grain sorghum, a crop with a narrower set of registered postemergence herbicide options than corn or soybean. Specialists note that growth - stage restrictions limit which products can be applied safely and that late - season rescue treatments are largely unavailable once resistant Palmer amaranth becomes established. Recommendations emphasize building programs around effective soil - applied residual herbicides, timely postemergence applications matched to weed size, and integrating cultural practices such as narrow rows and competitive hybrids to reduce escapes.
