카드 요약 / 당시 확인 내용

Maryland - based Silvec, founded in 2019 by siblings Rafael and Anne Simon, uses a modified citrus tristeza virus as a delivery vehicle to make citrus trees produce defensin, an antimicrobial peptide that fights huanglongbing (citrus greening). Rather than requiring fermentation facilities, Silvec inoculates a mother tree; buds harvested from that tree are grafted into other citrus trees, naturally transferring the protective benefit. The virus strain originated from U.S. Sugar subsidiary Southern Gardens Citrus. Silvec has received EPA registration for the technology and expects commercial availability in 2028. The company has been supported primarily by USDA and the citrus industry, expects profitability next year, and is launching a Series A round. Field trials demonstrated effectiveness, though the company frames it as one tool among many rather than a complete solution to a disease currently managed with oxytetracycline injections and insecticide sprays against psyllid vectors.
