카드 요약 / 당시 확인 내용

Nebraska CropWatch reported on July 17, 2026 that flowering soybeans are entering the critical window for white mold risk assessment. Warm weather has delayed disease development and no apothecia had been observed in scouting at the time of publication, but rainfall and extended canopy moisture can quickly raise risk. CropWatch said soybeans are most susceptible during flowering, and fungicides are most effective when applied during the flowering window before infection occurs; late applications will not protect infected plants.
