카드 요약 / 당시 확인 내용

A new scientific analysis published in Science is intensifying concerns over the European Commission's Food and Feed Safety Omnibus proposal, just days before a key Member State vote on 26 June. Scientists from 27 European research institutions warn the proposal would 'increase risks to human health and the environment, reduce incentives for safer pest-control alternatives, and undermine trust in regulatory decision-making.' Proposed changes include unlimited approvals for low-risk substances, extended renewal periods for conventional substances up to 25 years, loosened biocontrol definitions (risking synthetics like pyrethroids qualifying), and expanded derogations, while restricting Member States' ability to use the latest science. 49 pesticides face unlimited approval; 28 approved PFAS pesticides produce the TFA metabolite.
