카드 요약 / 당시 확인 내용

Michigan State University Extension reported on July 23, 2026 that soybean white mold fungicide applications should be made between R1 and R3, with the Crop Protection Network risk tool showing high risk on irrigated soybeans in southwest Michigan. The update also advised scouting corn for tar spot as reproductive stages begin and noted tar spot fungicides are most profitable between R1 and R3. Western bean cutworm trap counts also spiked in Branch and Van Buren counties.
