카드 요약 / 당시 확인 내용

The European Commission's Joint Research Centre analyzed the potential economic impacts of the proposed Food and Feed Omnibus, which would reduce maximum residue levels for 18 pesticide substances to the limit of quantification, effectively blocking imports containing residues of these substances. The study covered 235 commodities and 86 exporting countries, identifying about 10,583 affected substance - commodity - country combinations. In a no - adaptation scenario agricultural imports would decline 41% (citrus - 92%, soybeans - 90%), with coffee prices rising 332%, soybean cake 105% and citrus 85%; intermediate and lower - bound scenarios show 8% and 0.4% declines. About \$16 billion of US agricultural exports are at risk, roughly 30% of EU agricultural imports in the examined categories. EU crop production would rise 1.1% with 1.9 million hectares more farmland. The JRC cautioned the study is not a formal impact assessment and does not account for transition periods; the proposal remains under legislative review.
