카드 요약 / 당시 확인 내용

CABI's PlantwisePlus programme reported that biocontrol of the invasive papaya mealybug is delivering measurable benefits in Kenya and Uganda. Compared with a 2019 baseline, introduction of the parasitic wasp *Acerophagus papayae*, a natural enemy of the mealybug, increased yields by 19%, sales by 18% and household income by 57%. In Kenya the wasp is now established across much of the country; in 2025 scientists released it on more than 440 farms and confirmed establishment in at least 17 counties. In Uganda the project is now led almost entirely by the National Agricultural Research Organisation (NARO) and its National Crops Resources Research Institute, with a fully functional production unit supplying wasps for nationwide releases that expanded to 12 new districts in 2025. Both countries will continue releases and monitoring alongside further socioeconomic assessments in 2026.
