카드 요약 / 당시 확인 내용

The U.S. EPA registered two novel herbicide active ingredients designed to address resistant weed problems in major crops. Bayer CropScience's diflufenican (trademarked Convintro) is described by the agency as the first effective PDS inhibitor herbicide for control of waterhemp, Palmer amaranth, and other pigweed species in corn and soybean, offering a new Group 12 mechanism of action for pre - plant and preemergence applications. Valent U.S.A. LLC's epyrifenacil (Rapidicil) provides broad - spectrum burndown control in canola, corn, soybeans, wheat, and fallow land, including weeds resistant to other PPO - inhibitor herbicides. Agricultural organizations praised the registrations as critical tools for managing evolving weed resistance challenges facing American farmers.
