카드 요약 / 당시 확인 내용

The EPA approved trifludimoxazin, a persistent pesticide classified as a PFAS forever chemical, for use on wheat, oats, oranges, apples, and almonds. This approval on Tuesday represented the third new forever - chemical pesticide authorized in a single day, alongside diflufenican and epyrifenacil. Under the Trump administration, five PFAS pesticides have been approved in less than two years, compared to just one during the entire Biden administration. The EPA determined that trifludimoxazin will degrade into 12 different PFAS chemicals and classified it as having suggestive evidence of carcinogenic potential based on thyroid tumors in animal studies. The agency also approved new uses of bifenthrin, chlormequat, and fluoxapiprolin, with chlormequat already detected in the urine of about 90% of Americans.
