카드 요약 / 당시 확인 내용

A Corn Disease Working Group study analyzed 152 fungicide efficacy trials across 18 states and Ontario from 2019 - 2022 to determine when corn fungicide applications pay off. The research found fungicides provided about 5 bu/acre yield benefit when final disease severity exceeded 5%. Applications at tasseling and silking stages (VT/R1) delivered the greatest returns of 5 - 6 bu/acre compared to untreated controls. Most fungicides showed positive ROI except Xyway LFR and Delaro Complete, with profitability varying by disease - pressure levels. The CPN Crop Risk Tool helps growers determine fungicide necessity using weather data and disease models for tar spot, gray leaf spot, and other corn diseases.
