카드 요약 / 당시 확인 내용

On 30 June 2026, Health Canada introduced a new policy permitting the use of remotely piloted aircraft systems (RPAS, or drones) to apply pesticides already approved for conventional aerial application, following the same label instructions. The policy followed a 30 - day consultation launched on 23 February 2026 that generated more than 150 comments from stakeholders expressing substantial support. Health Canada stated that drone use for pesticides does not present any additional health or environmental risks compared with traditional aerial spraying, while offering greater precision and reduced fuel use and emissions. As of 30 June, operators must comply with all federal and provincial/territorial laws, including obtaining a valid drone pilot certificate from Transport Canada, and the person who mixes and loads the chemicals must not be the drone pilot. By adopting this policy Health Canada brings Canada into alignment with other countries such as Australia and Japan.
