카드 요약 / 당시 확인 내용

Iowa State University Extension agronomists urged farmers on August 31, 2026 to scout corn fields for crown rot, confirmed in Iowa and possibly other parts of the Corn Belt. Early symptoms include stunted plants, wilting, yellowed lower leaves and brown - to - black roots; late - season symptoms include premature plant death and a grayish - green appearance known as ghost plants. Reduced water and nutrient uptake leads to poor stalk quality and potential lodging. Recommendations: scout immediately, harvest fields with 10% or greater crown rot incidence as soon as corn matures, document which hybrids show susceptibility for future seed selection, and prioritize affected fields for early harvest. According to Bayer Crop Science and the Crop Protection Network, few foliar or seed/soil - applied chemistries provide consistent protection and control, and the disease cause remains poorly understood, making hybrid resistance selection crucial. Southern rust pressure was lighter than the previous year in Iowa.
