카드 요약 / 당시 확인 내용

University of Nebraska - Lincoln Extension published guidance on September 1, 2026 recommending certified wheat seed ahead of planting. Certified seed provides verified purity, germination and seed quality, access to improved genetics and reduced weed contamination compared to bin - run alternatives, and germination/purity testing lets growers adjust seeding rates based on moisture conditions and planting date. Bin - run seed may carry pathogens causing diseases like scab or smut that carry over into the next growing season, potentially causing total field losses; 62% of bin - run samples showed severe seed damage or varietal purity problems. Research cited shows certified seed yielded 1.2 - 3.5 bushels per acre more than wheat planted with bin - run seed. Growers choosing saved seed are advised to apply an appropriate seed treatment. For most Nebraska wheat growers, certified seed is one of the most reliable investments for improving stand establishment.
