카드 요약 / 당시 확인 내용

Sulfur prices have surged past \$1,000 per metric ton in global spot markets, according to University of Illinois agricultural economists, a dramatic increase from early 2025 levels. Two supply disruptions are responsible: the Strait of Hormuz blockade blocking sulfur exports from Middle Eastern oil refineries, and Russia's export ban eliminating the world's second - largest traded sulfur source — together removing roughly two - thirds of globally traded sulfur. Sulfuric acid is essential for converting phosphate rock into phosphoric acid, DAP and MAP. DAP prices currently exceed \$820 per metric ton versus the \$500 - 600 range in early 2025, with raw material cost increases explaining much of the gap and sulfur representing a substantially higher share of DAP production costs. The analysis warns that 2027 U.S. farm budgets should anticipate phosphate fertilizer costs at or above current levels, with growers facing prolonged input cost pressure and potential reductions in phosphate application rates for lower - margin crops.
