카드 요약 / 당시 확인 내용

Nebraska Extension reports that fall armyworm moth captures have increased in Nebraska Extension traps since the beginning of August, with pheromone traps positioned in Clay County and near Mead to track male moth activity. Extension entomologist Silvana Paula - Moraes and educators David S. Wangila and Matheus Ribeiro advise scouting alfalfa, pasture and grazing lands, small grains and cover crops. The management threshold is 2 - 3 larvae per square foot for chemical intervention decisions. Use a heavy - duty sweep net targeting areas with visible damage and sample at least four locations per field; caterpillars hide at soil level during daylight so check transition zones between damaged and healthy vegetation. Several insecticides are available but selection must account for grazing and haying restrictions. For larger caterpillars exceeding three - quarters of an inch chemical control is not recommended and cutting alfalfa becomes the preferred alternative, provided timing will not compromise winter survival.
