카드 요약 / 당시 확인 내용

University of Nebraska - Lincoln CropWatch guidance by Jade Horn, Doctor of Plant Health graduate student, and Josh Villazana, Pesticide Safety Education Program Coordinator, sets out pollinator protection practices for pesticide applications. The label is law: pesticide labels contain legally required instructions and pollinator protection precautions that must be reviewed before application. Avoid applications during active bloom periods when pollinators forage and apply during evening or nighttime hours when bee activity is lowest; early morning applications also reduce exposure risks compared with daytime applications. To reduce spray drift use drift - reduction nozzles, maintain proper boom height, monitor wind speed and direction, use appropriate droplet sizes and spray pressure, and avoid applications during temperature inversions. When alternatives exist choose products with lower toxicity to bees and beneficial insects. Coordinate with nearby beekeepers using BeeCheck, a voluntary communication tool. Combine monitoring, economic thresholds, cultural practices and biological controls through integrated pest management.
