카드 요약 / 당시 확인 내용

CF Industries raised its mid - cycle EBITDA baseline to \$2.9 billion, substantially higher than pre - conflict levels, signaling management's expectation that elevated nitrogen prices will persist as structural market dynamics rather than temporary disruption. The company said global nitrogen supply will remain structurally tight through at least 2027. The Iran conflict removed approximately 4 - 4.5 million metric tons of urea and roughly 1 million metric tons of ammonia from international trade, and the supply deficit created by the Hormuz blockade cannot be quickly resolved due to damaged port infrastructure, depleted inventories and insurance complications. No major new nitrogen capacity is scheduled globally before late 2028, and brownfield expansions face extended timelines for equipment procurement and permitting. CF Industries generated \$1.1 billion in free cash flow during the first half of 2026 and returned \$700 million to shareholders. The company continues evaluating clean ammonia opportunities including potential off - take agreements enabling premium pricing once carbon border adjustment mechanisms such as the EU's CBAM take effect.
