카드 요약 / 당시 확인 내용

AgroSpheres and FMC Corporation announced on September 17, 2026 that two proprietary RNA - based biomolecule candidates from AgroSpheres' pipeline are entering global field trial development, moving from laboratory and greenhouse evaluation into testing across commercial growing environments in the United States, Brazil and Asia. The candidates were developed under a multi - year collaboration first announced in 2024 and are being evaluated against major lepidopteran pests including fall armyworm and diamondback moth, which with other moth and caterpillar species account for nearly \$14 billion in annual global crop losses and pest - control costs. The transition follows testing in laboratories, greenhouses and small - scale field plots, with candidates benchmarked against industry - standard chemistries and meeting or exceeding performance benchmarks. AgroSpheres' biomodality platform designs biomolecules that act on specific targeted biological pathways within a pest rather than relying on broad chemical action.
