## 카드 요약 / 당시 확인 내용

The Nebraska Soybean Board sponsors complimentary SCN soil analysis for samples collected from Nebraska fields (announced September 17, 2026). End-of-season testing is optimal because SCN population levels are likely at their highest and problem areas remain fresh in farmers' minds for targeted sampling. SCN can cause yield losses of up to 30% without producing significant aboveground symptoms and costs U.S. producers approximately \$1.5 billion annually; as of 2026 it has been confirmed in 64 Nebraska counties. Producers request free sampling bags from the UNL Plant and Pest Diagnostic Clinic, collect 15 - 20 soil cores from the 6 - 8 inch root zone in a zigzag pattern across 10 - 20 acres, and mail composite samples with field information. Once confirmed, rotate resistant variety sources, alternate with non-host crops like corn or wheat, consider nematode-protective seed treatments, and monitor populations every 2 - 3 years.
