카드 요약 / 당시 확인 내용

Switch Bioworks, a Stanford University spinout, appointed Gordana Djordjevic as Chief Science Officer as it scales operations and expands multi - state field trials across six Midwest corn belt states, targeting the 2026 growing season as the ultimate test of real - world performance. The company develops engineered nitrogen - fixing microbes using a genetic switch mechanism: a two - phase approach in which microbes first colonize plant roots before activating nitrogen fixation, addressing the challenge of engineered organisms being outcompeted by native soil bacteria. The company secured \$17 million in 2026 funding and holds a \$2 million ARPA - E grant from the U.S. Department of Energy. Modeling featured in MIT Technology Review suggests the microbes could eventually replace approximately 50% of synthetic nitrogen fertilizer in corn at yield parity. Field trial results are expected later in 2026, with potential commercial product development targeting the 2028 - 2029 planting season.
