Internal EPA records disclosed through public records requests show the EPA worked directly with Bayer in approving dicamba, presenting the company with different options for reducing drift and runoff. The EPA gave a presentation to Bayer in May 2025 — two months before the agency proposed to reapprove the herbicide — putting forth two options for mitigating dicamba drift at higher temperatures: one prohibiting applications above 85 degrees Fahrenheit, another allowing applications up to 95 degrees if treatments occur on 50% or less of a farmer's untreated dicamba-tolerant cotton and soybean acres. Bayer chose the second, less protective option, which the EPA cited in its final rule released in February 2026. Dicamba is notorious for drifting far from application sites and damaging other crops; federal courts struck down previous approvals in 2020 and 2024, citing the agency's refusal to estimate drift damage and failure to address input from drift victims.
