카드 요약 / 당시 확인 내용

Researchers Sonia Corina Hess and Leonardo Melgarejo, affiliated with the Latin American research network UCCSNAL, published findings on September 10, 2026 that of 429 pesticide active ingredients registered in Brazil, 223 lack authorization anywhere in the European Union, appearing in approximately 1,900 commercial products legally sold to Brazilian farmers. Examples include acephate, chlorothalonil (EU approval lost 2019), atrazine, S - metolachlor, glufosinate - ammonium, diquat and mancozeb (lost 2021). The analysis was reported by Blog do Pedlowski and circulated by advocacy groups; Global Agriculture noted it was not able to independently locate or verify the full underlying dataset. Brazil is the world's largest soybean exporter and a major supplier of corn, coffee and orange juice, with the EU among its largest export destinations, so the divergence represents trade friction and reputational risk regarding residue testing and production standards.
