카드 요약 / 당시 확인 내용

The U.S. EPA announced two scientific advancements designed to modernize safety reviews of new chemicals and pesticides while further eliminating reliance on animal testing, marking strides toward its goal of eliminating all mammalian animal testing by 2035. One method uses three - dimensional human airway tissue and computational models to assess inhalation effects of certain surfactant formulations. A separate method uses the Globally Harmonized System (GHS) mixtures equation to estimate acute oral toxicity for some pesticide formulations, following a comprehensive analysis conducted with the National Institute of Environmental Health Sciences evaluating nearly 700 pesticide formulations, which showed the mixtures equation can reliably identify products that are minimally toxic by the oral route. Using data - driven calculation formulas, the agency can assess risks based on a mixture's known ingredients, eliminating the need to test final blended products on animals.
