BASF Agricultural Solutions and the International Rice Research Institute (IRRI) announced on September 10, 2026 the extension of their OPTIMA Rice partnership. The first phase demonstrated that Alternate Wetting and Drying, enabled through Direct Seeded Rice, can significantly reduce methane emissions and water use without compromising yields, while improved straw management provides further emissions reductions. The second phase will focus more closely on the effects of water management on soil carbon and nitrogen, alongside the potential of biochar to store carbon while improving soil fertility and structure. Field trials are centred in the Philippines, but the partners intend findings to be relevant across major rice - growing regions including China, India, Japan, Brazil and Italy.
