Results of the 2026 National Cover Crop Survey, the ninth report published by CTIC and USDA SARE with the American Seed Trade Association since 2013, were released September 1 at the Farm Progress Show. The survey was completed online by 657 farmers in 46 U.S. states and Puerto Rico. Key findings include a mean yield increase of 3.5 bushels per acre of corn and 1.4 bushels per acre of soybeans following cover crops. Better weed control following cover crops was reported by 31.2% of all cover crop users, and by 87% of growers who planted green into live, standing covers. Average acreage planted with cover crops was 397.9, projected to cross 400 acres next year. One in three cover crop users reported grazing cover crops or harvesting them for livestock, and 77% of those who grazed said it increased profit.
