카드 요약 / 당시 확인 내용

Common social wasps across Britain are mysteriously scarce this summer, according to research led by Professor Seirian Sumner of University College London, reported September 11, 2026 via The Conversation. Researchers cannot locate specimens for experiments and professional pest - control services report unusually few nest - removal requests compared to previous years. Primary suspected causes are extreme spring temperature fluctuations (warm, dry periods interrupted by cold damp days and chilly nights), multiple consecutive heatwaves exceeding critical thermal tolerances, and prey scarcity limiting colony food. Surviving wasps are unusually small, suggesting restricted larval nutrition or heat - induced faster development at reduced body sizes. Wasps function as pest - controllers, pollinators and decomposers; the citizen - science Wasp Picnic Survey 2026 (Ham or Jam?) aims to quantify the decline.
