카드 요약 / 당시 확인 내용

Nebraska's crop progress report for the week ending September 7, 2026 (published September 8) showed corn development lagging, with only 14% at maturity versus 22% the prior year and the 25% five - year average, though 74% had reached the denting stage. Winter wheat planting remained at 0% completion, significantly behind 7% last year and the 4% five - year average. Soybeans showed relative strength with 64% rated good to excellent and 19% of fields dropping leaves, slightly ahead of last year. Topsoil moisture was 54% very short to short, and producers had only 6.4 days suitable for fieldwork, constraining planting. The delayed corn maturity and absent wheat planting suggest complications for fall harvest schedules and spring planting timelines, with pasture conditions stressed overall.
