카드 요약 / 당시 확인 내용

Episode 72 of the University of Minnesota's MN Cropcast, published September 13, 2026, features Tony Licht of Premier Crop Systems (founded 1999, West Des Moines, Iowa) discussing how converting raw field data into economic insights supports farm profitability. Integrating soil samples, application records, weather data and yield monitoring helps visualize return on investment. Rather than uniform strategies across all acreage, the precision software segregates fields into productivity zones: high - yielding areas receive optimized variable - rate seeding and nutrient prescriptions, while lower - yielding zones get adjusted inputs to manage risk and preserve margins. Farmers can analyze cost per bushel and evaluate hybrid performance based on profit margin rather than yield alone, enabling more informed seed selection and field - level budgeting. Establishing a central data warehouse is the essential foundation for analytics - driven decision - making.
